INT 10,E - Write Text in Teletype Mode

```
AH = 0E
AL = ASCII character to write
BH = page number (text modes)
BL = foreground pixel color (graphics modes)

returns nothing

- cursor advances after write
- characters BEL (7), BS (8), LF (A), and CR (D) are
  treated as control codes
- for some older BIOS (10/19/81), the BH register must point
  to the currently displayed page
- on CGA adapters this function can disable the video signal while
  performing the output which causes flitter.
```
